

WHC Technology Program

The WHC Arbitrage Program aims to counteract two interconnected futures and take advantage of the different course. As an example, the coherence between the price of the US Dollar to the Canadian Dollar and oil. As oil prices rise, most of the time the Canadian dollar falls, and vice versa, we use this interaction in this program, and at the same time this interaction is also our risk minimization:

- ➔ Futures are bought or sold in coherence with each other
- ➔ The different course of the courses results in our profit or loss
- ➔ Because these futures behave coherently (mostly against each other), they are also our safety net at the same time.

The distribution of the total invested capital is usually in equal parts in the respective futures.
